

InvestorHub

PROJECT WORK LOGBOOK

Module: SSLCommerz Payments, Invoices & Identity Verification

Student Name: _____

Student ID: _____

Project: InvestorHub — Investor & Business Matching Platform

Technology: MERN Stack (MongoDB, Express, React, Node.js)

Duration: 1 September 2026 – 10 September 2026 (10 Days)

Supervisor: _____

DAY / DATE	ACTIVITIES	LEARNING (WHAT I LEARNED)
Day 1 Tuesday 1 Sep 2026	1. Analyzed the SSLCommerz hosted checkout flow (init, redirect, validate). 2. Designed the Investment schema with tranId, valId, and status fields. 3. Added SSLCommerz sandbox credentials and server URLs to the .env config.	Learned how a payment gateway session flow works end-to-end.
Day 2 Wednesday 2 Sep 2026	1. Built the payment init API with amount and listing validation. 2. Created gateway sessions and tested with sandbox (testbox) credentials. 3. Restricted investing to active business listings by investors only.	Learned server-side payment session creation and API security.
Day 3 Thursday 3 Sep 2026	1. Built the success, fail, cancel, and IPN callback routes. 2. Verified every payment with the SSLCommerz validation API (idempotent). 3. Auto-finalized accepted matches after a completed payment.	Learned to never trust redirect payloads — always re-validate server-side.
Day 4 Friday 4 Sep 2026	1. Added the "Invest Now" amount form on the post detail page. 2. Redirected users to the hosted gateway and handled the return flow. 3. Fixed the reload-logout bug with an authChecked guard in Redux.	Learned to handle async auth race conditions in route guards.
Day 5 Saturday 5 Sep 2026	1. Created the /payment/success, /payment/fail, and /payment/cancel pages. 2. Built the "Investments" dashboard page with totals and status filters. 3. Redesigned the investment list into a responsive table format.	Learned post-redirect UX design and table-based data presentation.

DAY / DATE	ACTIVITIES	LEARNING (WHAT I LEARNED)
Day 6 Sunday 6 Sep 2026	1. Generated PDF invoices with pdfkit (parties and admin only). 2. Built the invoice page with print and blob-download buttons. 3. Linked invoices from the investments table and the success page.	Learned PDF generation with pdfkit and blob file downloads.
Day 7 Monday 7 Sep 2026	1. Built the admin "Payments" page with filters, search, and pagination. 2. Added payment totals to admin analytics using MongoDB aggregation. 3. Gave admins access to view and download any completed invoice.	Learned MongoDB aggregation pipelines for revenue reporting.
Day 8 Tuesday 8 Sep 2026	1. Auto-marked posts "completed" once the funding goal is fully raised. 2. Hid funded posts from listings and showed a raised-progress bar. 3. Required a reason when admins reject posts; shown to the author.	Learned aggregate-driven status transitions and moderation UX.
Day 9 Wednesday 9 Sep 2026	1. Recorded the match sender (requestedBy) and blocked self-acceptance. 2. Allowed re-requesting after rejection and withdrawing sent requests. 3. Showed only incoming requests on the business dashboard.	Learned to model "who did what" for correct authorization.
Day 10 Thursday 10 Sep 2026	1. Built the NID onboarding page with imgbb-hosted uploads. 2. Added the admin NID viewer with approve / reject-with-note flow. 3. Fixed chat misalignment caused by stale socket identity after re-login.	Learned identity verification flows and socket auth pitfalls.
